

Unemployment Analysis with Python

Objective

The objective of this project is to analyze unemployment trends in India and understand the impact of Covid-19 on unemployment rates.

Dataset

The dataset contains:

- Region
- Date
- Estimated Unemployment Rate (%)
- Estimated Employed
- Labour Participation Rate
- Geographic Information

Technologies Used

- Python
- Pandas
- Matplotlib

Methodology

1. Load and clean the dataset.
2. Convert date information into a proper format.
3. Analyze unemployment rates across regions.
4. Visualize unemployment trends using graphs.
5. Examine the impact of Covid-19 on employment patterns.

Results

The analysis revealed significant increases in unemployment during the Covid-19 lockdown period. Regional differences in unemployment rates were also identified.

Conclusion

The project provides insights into employment trends and highlights the importance of economic recovery measures during crises.
